

Q.1) The electrical resistivity of Copper at 27°C is $1.72 \times 10^{-8} \Omega\text{-m}$. Compute its thermal conductivity if the Lorentz number is $2.26 \times 10^{-8} \text{ W}\Omega\text{-K}^{-2}$.

$$\text{Given } (\rho) = 1.72 \times 10^{-8} \Omega\text{-m}$$

$$\text{Given } \sigma = \frac{1}{\rho} = \frac{1}{1.72 \times 10^{-8}} \Omega^{-1}\text{-m}^{-1}$$

$$27^\circ\text{C} \Rightarrow 273 + 27 = 300 \text{ K}$$

$$L = 2.26 \times 10^{-8} \text{ W}\Omega\text{-K}^{-2}$$

According to Wiedemann-Franz law using classical free electron theory,

$$\frac{k}{\sigma} = LT \left[\frac{\text{Electrons}}{\text{Area}} \right] = T$$

$$(or) \quad k = \sigma LT \left[\frac{\text{Electrons}}{\text{Area}} \right] = T$$

$$k = \frac{LT}{\rho} \left[\frac{\text{Electrons}}{\text{Area}} \right] = T$$

$$\text{Therefore Thermal Conductivity } k = \frac{2.26 \times 10^{-8} \times 300}{1.72 \times 10^{-8}} \text{ W m}^{-1} \text{ K}^{-1}$$

$$k = 394.18 \text{ W m}^{-1} \text{ K}^{-1}$$

- Q.2) Using Fermi-Dirac distribution function, obtain the values of $F(E)$ for $E = E_F + 0.01 \text{ eV}$ at 200 K

Given $E - E_F = 0.01 \text{ eV}$

$$\text{Temperature } (T = 200 \text{ K}) = \frac{1}{k} = \frac{1}{1.38 \times 10^{-23} \text{ J K}^{-1}}$$

Boltzmann's Constant $(k_B) = 1.38 \times 10^{-23} \text{ J K}^{-1}$

Using Fermi-Dirac distribution function $F(E) = \frac{1}{[e^{(E_i - E)/kT} + 1]}$

$$\text{Then } F(E) = \frac{1}{[e^{(0.01 \times 1.6 \times 10^{19}) / (1.38 \times 10^{-23} \times 200)} + 1]}$$

$$F(E) = \frac{1}{[e^{0.5797 + 1}]} = \frac{1}{e^{0.5797}} = 0.359$$

Q-3) Free electron density of aluminium is $18 \cdot 10^{28} \text{ m}^{-3}$. Calculate
 2) Radii Fermi energy at 0K. Planck's Constant and mass of
 free electron are $6 \cdot 62 \times 10^{-34} \text{ Js}$ and $9 \cdot 1 \times 10^{-31} \text{ kg}$

Given that Electron density of aluminium (n) = $18 \cdot 10^{28} \text{ m}^{-3}$

$$\text{Planck's Constant } (h) = 6 \cdot 62 \times 10^{-34} \text{ Js}$$

$$\text{Mass of electron } (m) = 9 \cdot 1 \times 10^{-31} \text{ kg}$$

For a given system, (E_F) at 0K is

$$E_F = \frac{h^2}{2m} \left[\frac{3n}{8\pi} \right]^{2/3}$$

$$E_F = \frac{(6 \cdot 62 \times 10^{-34})^2}{2 \times 9 \cdot 1 \times 10^{-31}} \left[\frac{3 \times 18 \cdot 10^{28}}{8 \times 3 \cdot 14} \right]^{2/3}$$

$$E_F = 1 \cdot 869 \times 10^{-18} \text{ J}$$

4) Calculate the number of states lying in an energy interval of 0.01 eV above the Fermi level for a crystal of unit volume with Fermi energy $E_F = 3 \cdot 0 \text{ eV}$

$$\text{Given } E_F = 3 \cdot 0 \text{ eV} \Rightarrow 3 \times 1 \cdot 6 \times 10^{-19} = 4 \cdot 8 \times 10^{-19} \text{ J}$$

$$\Delta E = 0.01 \text{ eV} = 0.01 \times 1.6 \times 10^{-19} \text{ J} = 1.6 \times 10^{-21} \text{ J}$$

$$\text{We know } (h) = 6 \cdot 63 \times 10^{-34} \text{ Js} \quad \text{and } (m) = 9 \cdot 1 \times 10^{-31} \text{ kg}$$

$$\text{Let } \Delta E = E - E_F$$

$$\Delta E + E_F = E = (3 + 0.01) \text{ eV} = E$$

$$1.6 \times 10^{-21} = (3.01 \times 1.6 \times 10^{-19}) \text{ J} = E$$

$$\Rightarrow 4.816 \times 10^{-19} \text{ J} = E$$

Number of states per unit volume lying between E & E_F is given by

$$N = \frac{4\pi}{h^3} (2m)^{3/2} \int_{E_F}^E (E)^{1/2} dE$$

$$= \frac{4\pi}{h^3} \times (2m)^{3/2} \times \left[\frac{2}{3} (E)^{3/2} \right]_{E_F}^E$$

$$N = \frac{4\pi}{h^3} \times (2m)^{3/2} \times \frac{2}{3} [E^{3/2} - E_F^{3/2}]$$

$$N = \frac{4\pi}{h^3} \times (2m)^{3/2} \times \frac{2}{3} [E^{3/2} - E_F^{3/2}]$$

$$n = \frac{4 \times 3.14 \times [2 \times 9.1 \times 10^{-31}]^{3/2}}{(6.63 \times 10^{-34})^3} \times \frac{2}{3} [(4.816)^{3/2} - (4.8)^{3/2}] \times [1.6 \times 10^{-19}]^{3/2}$$

$$n = 3.74 \times 10^{55} \times (1.108 \times 10^{-30})$$

$$n = 4.14 \times 10^{25} \text{ m}^{-3}$$

5) Find the lowest energy of an electron confined in one dimensional potential box separated by distance 0.1 nm

Given $\lambda = 0.1 \text{ nm}$ \Rightarrow we know $\lambda = 6.62 \times 10^{-34} \text{ J}$

We know Energy of electron in 1-D Box is 

$$\text{Energy level } E_n = \frac{n^2 h^2}{8m\lambda^2}$$

To find lowest energy of an electron ($n=1$)

$$E_1 = \frac{(1)^2 \times (6.62 \times 10^{-34})^2 / (0.1 \times 10^{-9})^2}{8 \times (9.1 \times 10^{-31}) \times (0.1 \times 10^{-9})^2}$$

$$E_1 = \frac{4 \cdot 38244 \times 10^{-67}}{728 \times 10^{-31} \times 10^{-18}}$$

$$E_1 = 6.0198 \times 10^{-19} \text{ J}$$

6) An electron is bound in one dimensional infinite well of width $1 \times 10^{-10} \text{ m}$. Find the energy value in the ground state and first two excited states.

Given $\lambda = 1 \times 10^{-10} \text{ m}$ & we know $\lambda = 6.62 \times 10^{-34} \text{ J}$

$$\text{we know } E_n = \frac{n^2 h^2}{8m\lambda^2}$$

To find lowest energy of an electron ($n=1$)

$$E_1 = \frac{(1)^2 \times (6.62 \times 10^{-34})^2}{8 \times (9.1 \times 10^{-31}) \times (1 \times 10^{-10})^2}$$

$$E_1 = 6.031 \times 10^{-17} \text{ J}$$

Energy of first excited state = $4 \times 0.6031 \times 10^{-17} \text{ J}$

Energy of second excited state = $9 \times 0.6031 \times 10^{-17} \text{ J}$

$$= 5.428 \times 10^{-17} \text{ J}$$

(7) Evaluate the fermi function for an energy kT above the Fermi energy.

$$\text{Given } E - E_F = kT$$

$$\text{we know } F(E) = \frac{1}{e^{(E-E_F)/kT} + 1}$$

$$\text{Therefore } F(E) = \frac{1}{e^{(kT/kT) + 1}} = \frac{1}{e^{0+1}} = 0.367 \quad (a)$$

$$F(E) = \frac{1}{3.718} = 0.268$$

8) In a solid, consider the energy level lying 0.01 eV below Fermi level. What is the probability of this level not being occupied by an electron?

$$\text{Given } E - E_F = 0.01 \text{ eV} \quad \text{we know } k = 1.38 \times 10^{-23} \text{ J K}^{-1}$$

$$\text{Assume } T = 300 \text{ K} \Rightarrow kT = 0.026 \text{ eV}$$

To find probability of an energy level E not being occupied by an electron in given by

$$1 - F(E) = \frac{1}{1 + e^{(E-E_F)/kT}} = \frac{1}{1 + e^{(E_F-E)/kT}}$$

$$\text{Now since } E_F \text{ is Fermi energy} \\ \text{and } E = E_F + 0.01 \text{ eV} \\ \text{then } 1 - F(E) = \frac{1}{1 + e^{0.01/0.026}} = \frac{1}{1 + e^{0.385}} = \frac{1}{1 + 1.47} \\ = 0.405$$

9) Find the temperature at which there is 1% probability of a state with an energy 0.5 eV above Fermi energy

$$\text{Given } E = E_F + 0.5 \text{ eV} ; F(E) = 1\% = 0.01$$

$$\text{We know } F(E) = \frac{1}{1 + e^{(E-E_F)/kT}}$$

$$\text{Then } 0.01 = \frac{1}{1 + e^{0.5/kT}} \quad \text{or } k = 1.38 \times 10^{-23} \text{ J K}^{-1}$$

$$1 + \exp\left(\frac{0.5}{kT}\right) = \frac{1}{0.01}$$

$$\exp\left(\frac{0.5}{kT}\right) = 99$$

$$\frac{0.5}{kT} = \ln(99) \approx 4.58 \times 10^{-19}$$

$$\frac{0.5}{kT} = \frac{0.5}{1.38 \times 10^{-23}} \text{ J K}^{-1}$$

$$T = 12.61 \text{ K}$$

10) The Fermi level for potassium is 0.1 eV. Calculate the velocity of the electron at the Fermi level

$$\text{Given } E_F = 0.1 \text{ eV}$$

$$\text{we know } E_F = \frac{1}{2} m V_F^2 \Rightarrow V_F = \left(\frac{2E_F}{m} \right)^{\frac{1}{2}}$$

$$\text{Then } V_F = \left[\frac{2 \times 0.1 \times 1.602 \times 10^{-19}}{9.11 \times 10^{-31}} \right]^{\frac{1}{2}}$$

$$V_F = 8.6 \times 10^5 \text{ m/s}$$

11) Calculate the k-value for an electron in the conduction band of GaAs having energy of 0.01 eV (measured from band edge). Compare this to the case where the electron in free space. The effective mass of electron in GaAs is 0.067 nm

$$\text{we know } k\text{-value is given by } k = \frac{\sqrt{2mE}}{\hbar}$$

For GaAs appropriate mass in conduction band is 0.067 m.

$$\text{Thus given } k = \left[\frac{2 \times (0.067 \times 9.1 \times 10^{-31})}{(0.1 \times 1.6 \times 10^{-19})} \right]^{\frac{1}{2}}$$

$$1.05 \times 10^{34} \text{ J}^{-1}$$

$$k = 4.2 \times 10^8 \text{ m}^{-1}$$

In free space we get $k = 1.625 \times 10^9 \text{ m}^{-1}$
 The two values are quite different since the k-value in the crystal represents an effective momentum

12) Calculate the energy of an electron and of a hole in the heavy hole band of semi conductor at a k-value of 0.1 Å.
 The heavy hole mass is 0.5 m.

$$\text{The electron energy in the valence band is } E_e = E_V - \frac{\hbar^2 k^2}{2m_h^*}$$

After using the parameter given we get

$$E_e = E_V - 1.21 \times 10^{-20} \text{ J} = E_V - 0.0755 \text{ eV}$$

The hole energy is inverse of electron energy

$$E_h = E_V + 0.0755 \text{ eV}$$

small streams. This is in agreement with the results with respect to the effect of the current on the flow.

WATER FLOW

$$\frac{d(\Delta h)}{dt} = \frac{A}{\rho g} \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

where A = cross-

sectional area of the stream bed, Δh = head difference between two points in the stream bed, ρ = density of water, g = acceleration due to gravity, q = discharge per unit width, x and y = horizontal and vertical distances from the origin, t = time.

$$\frac{d(\Delta h)}{dt} = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

Introducing q/A in equation (1) we get

$$d(\Delta h)/dt = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

$$= A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

Introducing q/A in equation (2) we get

$$d(\Delta h)/dt = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

Introducing q/A in equation (3) we get

$$d(\Delta h)/dt = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

Introducing q/A in equation (4) we get

$$d(\Delta h)/dt = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

Introducing q/A in equation (5) we get

$$d(\Delta h)/dt = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

Introducing q/A in equation (6) we get

$$d(\Delta h)/dt = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$

Introducing q/A in equation (7) we get

$$d(\Delta h)/dt = A \left(\frac{\partial}{\partial x} \left(\frac{q}{A} \right) + \frac{\partial}{\partial y} \left(\frac{q}{A} \right) \right) - \frac{1}{\rho g} \frac{\partial q}{\partial t}$$
